SONEL Analysis™ software is an application used to work with PQM-707 power quality analyzer. It enables:

- reading data from the analyzer,
- network parameters check in real time,
- data presentation in tables,
- data presentation in diagrams,
- data analysis according to EN 50160 or according to user defined conditions,
- independent service of multiple analyzers,
- software upgrade through the Internet.

Live mode

“SONEL Analysis” software enables reading of selected parameters and their graphic presentation in real time. These parameters are measured independently of the registration saved in the memory. User can check:

- voltage and current diagrams (oscilloscope)
- diagrams of voltage and current in time function,
- scope phasor,
- different parameters values,
- harmonics.

Data analysis

With “SONEL Analysis” software user can read data stored on the memory card and analyze them. Data from the analyzer can be stored on hard drive and be used later. This feature enables data archiving.

The user can analyze the data from the device. There is a choice of:

- **General** – all data are shown with dots (Measurements, Events and Waveforms),
- **Measurements** – all measured values registered in averaging time are shown in table (voltage, frequency, etc.),
- **Events** – all detected events are shown in table (dips, swells, interruptions, etc.),
- **Configuration** – all data settings are shown.

The software enables different types of diagrams, which show in a simple way the registered data:

- **Time diagram** – graphs of indicated parameters in time function,
- **Waveforms** – graphs of instantaneous voltage and current during an event or at the end of averaging time,
- **Harmonics diagram** – bar graph showing harmonics from 1 to 40,
- **Value/Time diagram** – graph of events' duration time.

With data from the analyzer user can prepare reports, which can be saved on the hard drive in PDF, HTML, CSV or TXT files. The software enable to prepare the report according to EN 50160 standard.
